

Seed

Every pumpkin starts as a seed. When planted in warm soil and given water, the seed begins to grow.

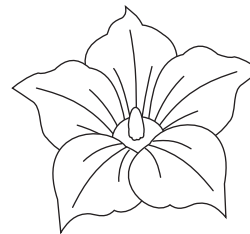

Sprout

A small sprout pushes up through the soil. Its first leaves help it soak up sunlight and make energy.

Vines

The plant grows long, twisting vines with large green leaves. The vines spread out to make room for pumpkins to grow.

Flowers

Bright yellow flowers bloom along the vines. Bees carry pollen from flower to flower, helping pumpkins begin to form.

Green Pumpkin

A tiny green pumpkin starts growing where a flower once bloomed. It gets bigger as the plant provides water and nutrients.

Pumpkin

The pumpkin grows to its full size and changes color as it ripens. Once its skin is firm and its color is bright, it's ready to harvest!
